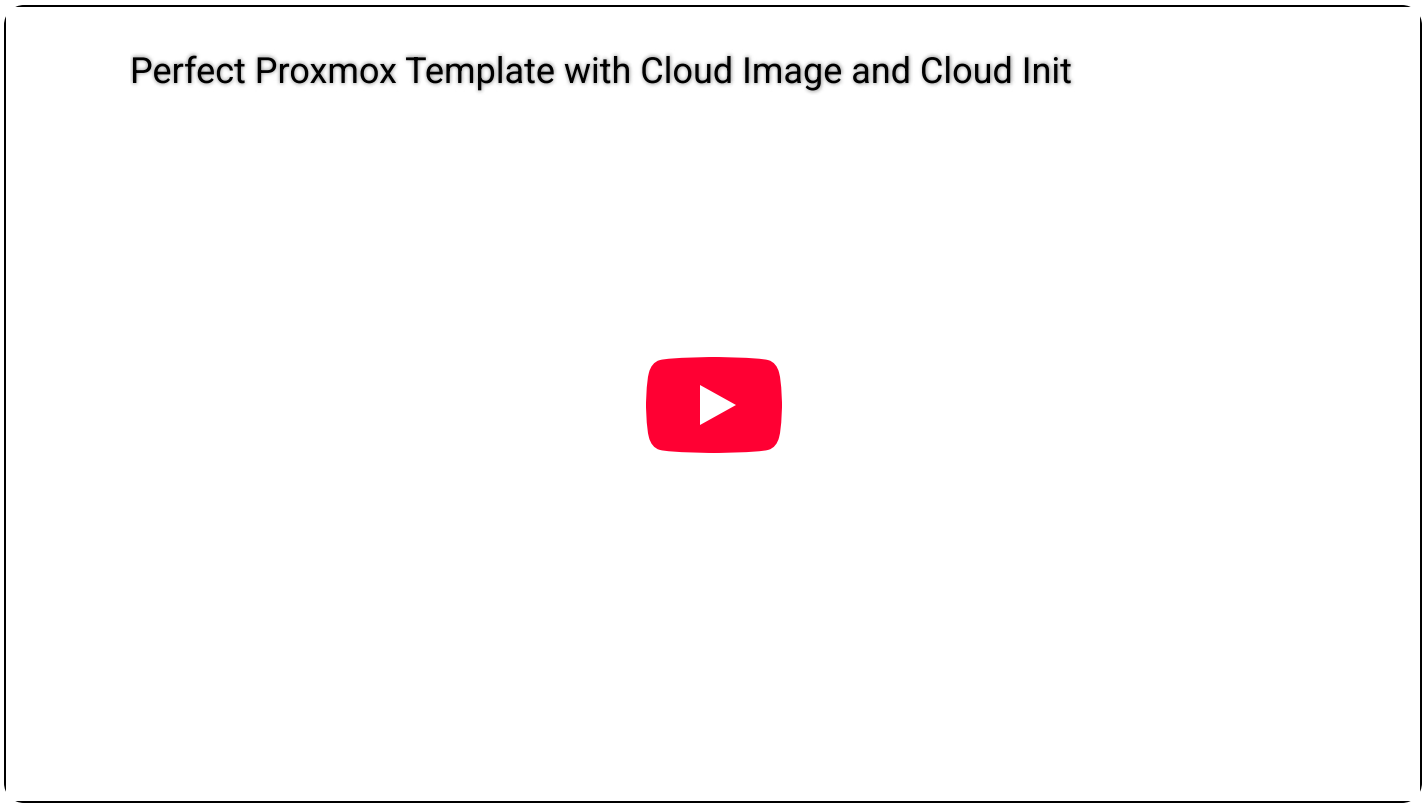
Using Cloud Images and Cloud Init with Proxmox is easy, fast, efficient, and fun! Cloud Images are small images that are certified cloud ready that have Cloud Init preinstalled and ready to accept a Cloud Config.Cloud Images and Cloud Init also work with Proxmox and if you combine the two you have a perfect, small, efficient, optimized clone template to provision machines with your ssh keys and network settings.So join me as we discuss, set up, and configure Proxmox with Cloud Images and Cloud Init.



📺 Watch Video

Instructions

Choose your Ubuntu Cloud Image

Download Ubuntu (replace with the url of the one you chose from above)

```shell
wget https://cloud-images.ubuntu.com/noble/current/noble-server-cloudimg-amd64.img
```

Create a new virtual machine

```shell
qm create 8000 --memory 2048 --core 2 --name ubuntu-cloud --net0 virtio,bridge=vmbr0
```

Import the downloaded Ubuntu disk to `local` storage (Change `local` to the storage of your choice)

Shell

```shell
qm disk import 8000 noble-server-cloudimg-amd64.img local
```

Attach the new disk to the vm as a scsi drive on the scsi controller (Change `local` to the storage of your choice)

Shell

```shell
qm set 8000 --scsihw virtio-scsi-pci --scsi0 local:vm-8000-disk-0
```

Add cloud init drive ((Change `local` to the storage of your choice)

Shell

```shell
qm set 8000 --ide2 local:cloudinit
```

Make the cloud init drive bootable and restrict BIOS to boot from disk only

Shell

```shell
qm set 8000 --boot c --bootdisk scsi0
```

Add serial console

Shell

```shell
qm set 8000 --serial0 socket --vga serial0
```

DO NOT START YOUR VM

Now, configure hardware and cloud init, then create a template and clone.If you want to expand your hard drive you can on this base image before creating a template or after you clone a new machine.I prefer to expand the hard drive after I clone a new machine based on need.

Create template.

Shell

```
qm template 8000
```

Clone template.

```shell
qm clone 8000 135 --name yoshi --full
```

Troubleshooting

If you need to reset your machine-id

```shell
sudo rm -f /etc/machine-id
sudo rm -f /var/lib/dbus/machine-id
```

Then shut it down and do not boot it up.A new id will be generated the next time it boots.If it does not you can run:

```shell
sudo systemd-machine-id-setup
```
