Install Windows 11 22H2

Seems that Microsoft has made it more difficult to not create a Windows account when there's no Internet during initial install.

This creates issues for Proxmox installing Windows 11 if you pick the VirtIO network device.

Here's a way around that. When you get to the "Let's Connect You To The Network" screen and the next button stays disabled unless you connect, do the following.

- Press SHIFT-F10 to bring up a cmd window
- Press Win key + E to bring up an explorer window

Now you have an explorer window open, you can install all the drivers needed off the driver ISO you previously mounted as per https://pve.proxmox.com/wiki/Windows_10_guest_best_practices

Soon as the network driver is installed, the Next button will pop up.

Hope this helps someone. Cheers!

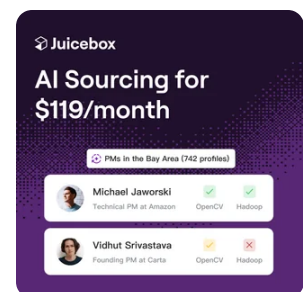

Edit: I should clarify I usually test install Pro and Enterprise versions. Haven't tried this with Home.

Also works on Win10 surprisingly which means it's programmed into their login script on their page.

poncewattle OP • 4y ago

Nice. Right now I'm just testing some Intune deployment scenarios so I'm wanting to log in with someone's 365 credentials, but that's good to know. Thanks!

chkpwd • 4y ago

Learning intune and autopilot right now. Mind if I learn alongside you?

poncewattle OP • 4y ago

The good news is, there's loads of youtube tutorials about how to do it. The bad news is, Microsoft has changed the web interface so nothing in those videos can line up to what you are seeing when you try to follow along. :-(

getgoingfast • 4y ago

Ah, this is interesting. Did I just run into MS dev giving away Christmas goodies? 🤔🤔

jfreak53 • 4y ago

Haha nah, I wouldn't work for those virus makers 😂

spdaimon • 2y ago

Homelab User

Another way I found is chose "Work or school" and then domain, then choose "sign in another way" and make a local account this way. I don't remember if that is all the steps exactly since I don't have it in front of me, but this is the jist. I do it this way to add a local admin for when I creating an image for 10 or 11.

SteveTech_ • 4y ago

There's also audit mode which you access by pressing CTRL+SHIFT+F3 during the OOBÉ.

Basically Windows will reboot and log itself into an administrator account so you can install whatever.

I've used it a few times when building PCs for family members, but your way is definitely faster for just the QEMU drivers.

**UnderqualifiedITGuy** • 2y ago

Just came across this and wanted to say thank you.

**cantanko** • 4y ago

Whilst on the account login screen, indeed press Shift+F10, but at the command prompt type

```
oobe\bypassnro
```

The out-of-box-experience will relaunch with the option to skip. No need to mess around.

**poncewattle** **OP** • 4y ago • Edited 4y ago

Nice, but I just tried it in a test VM and it rebooted but still requires internet when it reaches that part in the OOBE so seems they've "fixed" it in 22H2 install ISO.

Anyway, my real issue was trying to get all of my drivers installed including network but I need to get an explorer window open during the OOBE to do that.

Edit: Never mind, it "does" make a new option that "I don't have internet" so this still works.

-

**cantanko** • 4y ago

Haha yeah, I thought it'd failed first time round. The little blue mousecrap "I don't have internet" link isn't particularly intuitive.

**CITAKU** • 2y ago

Worked for me, thank you!

**cyber1kenobi** • 4y ago

Oooh my likey! Thx!

There is also a "load drivers" button when selecting which hard drive to install windows to. You have to load the virtio SCSI driver if you used the recommended hard drive format. But you can click load drivers again (and again) to install the network driver and ballooning driver.

**poncewattle** OP • 4y ago

Interesting. I did the load drivers but it only showed me the disk driver ones. Once I chose that one, if I hit it again it again only showed disk drivers. Anyway, once I get to the network fail thing, I just go ahead and run the guest install program on the ISO and it will install all the other drivers with it.

**[deleted]** • 4y ago

During the network connection screen (or any part of OOB), press Shift+F10 to open a prompt, then run the VirtIO MSI or EXE from there. Once installed, the network will connect and you can continue the setup.

**Capital-Intern-1893** • 4y ago

Choose setup as work account + choose domain setup. The account it first creates is a local account. (I did this as of last week)

**grimmju** • 2y ago • Edited 2y ago

In my case, Win+E did not work, but I knew I could just execute 'explorer.exe' in the terminal, and it was good to go. I'm just commenting in case anyone else has the same problem.

Then you just need to find the driver, select the file that appears with no extension, and right-click. It should have the option "Install." If it does, installed it and it's done.

Or can there be some legal issues?

jcol26 • 4y ago

Probably malice given they include the vmware ones as well as include the qemu drivers on all their cloud images 🤖

poncewattle [OP](#) • 4y ago

as well as include the qemu drivers on all their cloud images

Wow, that's pretty telling.

wildchai • 3y ago

Thanks... managed to use this to maneuver into the device manager and install all drivers.

coldplants • 2y ago

Thank you so much, really.

Embarrassed_Watch734 • 1y ago

I will add my experience: I am on a Mac, and I could not get the SHIFT + F10 to work.

What did work was a Fn + SHIFT + F3 (tapping F3 a few times) ... the Windows VM restarted into a Windows session (recovery?), and offered to reboot into OOBE. Instead, with the VirtIO CD, I go into Explorer and install the drivers. Rebooted, and it auto detected the network adapter and proceeded on.

And one of the best Proxmox guru in spanish: <https://www.youtube.com/c/nosolohacking>

**bootlesscrowfairy** • 4y ago

All you need to do is include the virtio driver iso during install. Atleast that's what worked for me last time I used virtio under windows.

**FederalAlienSnuggler** • 4y ago

Use "spammer" as user and a random password, you will get an error and then you can create a local user.
